#### Abstract

Macrobicycles derived from 1，8－disubstituted cyclam in principle may be planar－chiral provided that the second chain cannot rotate around the cyclam fragment．Hindered rotation is enabled by the introduction of two additional substituents at nitrogen atoms and by enough short chain which forms the second cycle．$N, N$＇，$N$＂，$N$＇＂＇－tetrasubstituted cyclams bearing two 3－bromobenzyl and two arylmethyl substituents were synthesized starting from protected bis－formaldehyde－ cyclam．These compounds were introduced in the Pd－catalyzed amination reactions with 1，3－diaminopropane，1，2－ diaminoethane and 1，2－diphenyl－1，2－diaminoethane to form corresponding macrobicycles．Various chiral diphosphine ligands were tested in these reactions and asymmetric induction was noted in some cases．The pronounced dependence of the chemical yields and enantiomeric excess on the nature of the starting compounds and chiral phosphine ligand was observed．The highest chemical yields of macrobicycles reached $50 \%$ ，the best enantiomeric excess was $13 \%$ when using Josiphos－type ferrocene－based ligand．

Keywords：Macrocycles，palladium－catalized amination，planar chirality，enantioselectivity．

#### Abstract

Макробиикль，содерэащие в своем составе фрагмент 1，8－дизамещенного ииклама，в приниие могут быть планарно－хиральными при условии，что цепь атомов，образующих второй макроцикл，не может свободно прокручиваться вокруг фрагмента циклама．Затрудненное вращение может быть обеспечено двумя дополнительными заместителями при атомах азота при условии небольшой длины ццепи второго цикла．$N, N^{\prime}, N^{\prime \prime}, N^{\prime ’ ’-т е т р а з а м е щ е н н ы е ~ и и к л а м ы ь, ~ с о д е р ж а щ и е ~ д в а ~ 3-б р о м б е н з и л ь н ы х ~ и ~ д в а ~ а р и л м е т и л ь н ы х ~}$ заместителя，были синтезированы из бис－формальдегид－ииклама．Данные соединения ввели в реакиии палладий－катализируемого аминирования с 1，3－диаминопропаном，1，2－диаминоэтаном и 1，2－дифенил－1，2－ диаминоэтаном，при этом были получены соответствующие макробициклы．В данных реакйях исследовали различные хиральные дифосфиновые лиганды и в некоторых случаях была отмечена асимметрическая

индукция. Наблюдалась сильная зависимость химических выходов и энантиомерных избытков от природьь исходных соединений и хиральных лигандов. Наибольшие химические выходы макробициклов составили $40-50 \%$, а наилучший энантиомерный избыток составил 13 \% в реакиии с 1,3-диаминопропаном при использовании лиганда типа Josiphos на основе 1,2-дизамещенного ферроцена.

Ключевые слова: Макроциклы, палладий-катализируемое аминирование, планарная хиральность, энантиоселективность.

## Introduction

In recent years much attention is paid to the design, synthesis and use of various macrocyclic receptors, since their cavity size and shape can be finely tuned. This useful feature led to the development of many applications of these compounds, including catalysis, transport of ions and molecules, development of molecular sensors, molecular machines, and applications in pharmacology. ${ }^{[1]}$ Chiral macrocyclic ligands are of special interest because they may be used as host molecules for asymmetric catalysis ${ }^{[2]}$ and chiral recognition. ${ }^{[3]}$ For example, lanthanide complexes, that catalyze asymmetric aldol reactions, were synthesized on the basis of chiral $\mathrm{N}, \mathrm{O}$-macrocycles, ${ }^{[4]}$ they were also used as catalysts in the enantioselective Michael addition reactions. ${ }^{[5]}$ Chiral carbohydrate-based crown ethers were employed as ligands in asymmetric hydrogenation. ${ }^{[6]}$ The catalysts for C-C coupling reactions may contain the complexes of chiral macrocycles with the transition metals. ${ }^{[7]}$ Macrocycles with planar chirality occupy a special position among other chiral macrocycles, and yet no general and convenient synthetic procedures has been developed for their synthesis. The simplest bicyclic compounds based on tetraazamacrocycles are various so-called cross-bridged cyclen and cyclam. ${ }^{[8-10]}$ The introduction of aromatic and heteroaromatic fragments in polymacrocyclic compounds often increases the conformational rigidity of the molecule thus fixing the cavity size. Also, these fragments are crucial in the creation of chemosensors because (hetero)aromatic moieties play the role of chromophores or fluorophores being responsible for the physical response to coordination. Usually macrobicycles possessing cross-bridged cyclen and cyclam moieties do not contain many donor atoms like nitrogen, oxygen or sulfur in the second cycle, ${ }^{[11-15]}$ however, described are macrobicycles with several donor atoms. ${ }^{[16]}$ Our own interest is drawn to the synthesis of macrobicyclic compounds derived from transdisubstituted cyclen and cyclam and we proposed simple routes to macrobicycles using Pd-catalyzed amination of bis(bromobenzyl) derivatives of tetraazamacrocycles. ${ }^{[17-20]}$ Also we were first to show the possibility to use Pdcatalyzed amination with chiral ligands for the synthesis of planar-chiral macrocycles based on 1,5-disubstituted anthracene and anthraquinone. ${ }^{[21]}$ In this work we decided to combine our approaches to macrobicyclic cryptands with asymmetric induction in the amination reaction in order to try the synthesis of planar-chiral macrobicycles.

## Experimental

NMR spectra were registered using Bruker Avance 400 spectrometer, MALDI-TOF spectra were obtained with Bruker

Autoflex II spectrometer using 1,8,9-trihydroxyanthracene as matrix and PEGs as internal standards. Enantiomeric excess was determined by means of HPLC with Bischoff liquid chromatograph using Chiralcel OD-H, Chiralpak IA, Kromasil 5-TBB, Welk O1 columns and various eluents containing combinations of hexane (heptane), $i$ - $\mathrm{PrOH}(\mathrm{MeOH}), \mathrm{THF}, \mathrm{CHCl}_{3}, \mathrm{Et}_{3} \mathrm{~N}$ and $\mathrm{HNEt}_{2}(0.7-1$ $\mathrm{ml} / \mathrm{min}, 230,254,260 \mathrm{~nm}$ UV detector), X-ray analysis of the compound 9 was done using CAD-4 Enraf-Nonius apparatus, the structure is deposited at Cambridge Structural Database (http:// www.ccdc.cam.ac.uk), deposit number CCDC 912600. Benzyl bromide, 3-bromobenzyl bromide, 2-(bromomethyl)naphthalene, 4-methylbiphenyl, propane-1,2-diamine, ethane-1,2-diamine, 1,2-diphenylethane-1,2-diamine, rac-BINAP, ( $R$ )-BINAP and other ferrocene-based chiral phosphine ligands, sodium tert-butoxide were purchased from Aldrich and Acros and used without further purification, $\mathrm{Pd}(\mathrm{dba})_{2}$ was synthesized according to the method described. ${ }^{[22]}$-(Bromomethyl)biphenyl was synthesized from 4-methylbiphenyl by a standard procedure using NBS in $\mathrm{CCl}_{4}$ with AIBN as radical initiator. Bis-formaldehide cyclam and 1,8-dibenzyl cyclam were provided by the CheMatech Co, Dijon, France. Dioxane was distilled over NaOH followed by the distillation over sodium under argon, dichloromethane and methanol were used freshly distilled.

Typical procedure for the synthesis of 1,8-bis(arylmethyl) derivatives of cyclam 5, 6 .

In a one-neck flask ( 100 ml ) bis-formaldehyde-cyclam (1) ( $2.50 \mathrm{~g}, 11.2 \mathrm{mmol}$ ) was dissolved in $52 \mathrm{ml} \mathrm{CH}_{3} \mathrm{CN}$, corresponding bromomethyl substituted arene (2-(bromomethyl)naphthalene or 4-(bromomethyl)bipehenyl, 22.4 mmol ) was added and the reaction mixture was stirred at room temperature for 72 h . The residue was filtered off, washed with $\mathrm{CH}_{3} \mathrm{CN}(3 \times 40 \mathrm{ml})$ and dried in vacuo to obtain di-salts 2 and 3 . The deprotection was carried out as follows: di-salt ( 2 or $3,5 \mathrm{mmol}$ ) was mixed with the aqueous solution of $\mathrm{NaOH}(8 \mathrm{~g}$ in 60 ml$)$ and stirred at $80-90^{\circ} \mathrm{C}$ for 48 h . The resulting compound ( $\mathbf{5}$ or $\mathbf{6}$ ) was taken with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, the solvent was evaporated in vacuo to give pure product.

1,8-Bis(2-naphthylmethyl)-4,11-diaza-1,8-diazoniatricyclo[9.3.1.14,8] hexadecane dibromide (2). Yield $5.80 \mathrm{~g}(78 \%)$, white crystalline powder, m.p. $>200^{\circ} \mathrm{C}$. ${ }^{1} \mathrm{H}$ NMR (DMSO- $d_{\sigma}, 298$ K) $\delta_{\mathrm{H}} \mathrm{ppm}: 1.72-1.82(2 \mathrm{H}, \mathrm{m}), 2.32-2.43(4 \mathrm{H}, \mathrm{m}), 2.84\left(2 \mathrm{H}, \mathrm{d},{ }^{2} J=\right.$ $14.7 \mathrm{~Hz}), 2.92\left(2 \mathrm{H}, \mathrm{d},{ }^{2} J=16.4 \mathrm{~Hz}\right), 3.17(2 \mathrm{H}$, br.s), $3.37(4 \mathrm{H}$, br.s), $3.53(2 \mathrm{H}, \mathrm{d}, J=10.0 \mathrm{~Hz}), 3.70(2 \mathrm{H}, \mathrm{t}, J=14.6 \mathrm{~Hz}), 4.45(2 \mathrm{H}, \mathrm{t}, J=$ $13.4 \mathrm{~Hz}), 4.87(4 \mathrm{H}, \mathrm{s}), 5.48\left(2 \mathrm{H}, \mathrm{d},{ }^{3} J=9.1 \mathrm{~Hz}\right), 7.60-7.67(4 \mathrm{H}, \mathrm{m})$, $7.72\left(2 \mathrm{H}, \mathrm{d},{ }^{3} J=8.4 \mathrm{~Hz}\right), 8.02\left(4 \mathrm{H}, \mathrm{d},{ }^{3} J=7.3 \mathrm{~Hz}\right), 8.06\left(2 \mathrm{H}, \mathrm{d},{ }^{3} J\right.$ $=8.0 \mathrm{~Hz}), 8.21(2 \mathrm{H}$, br.s).

1,8-Bis(biphenyl-4-ylmethyl)-4,11-diaza-1,8-diazoniatricyclo[9.3.1.14.8]hexadecane dibromide (3). Yield $3.20 \mathrm{~g}(64 \%)$. white crystalline powder, m.p. $>200^{\circ} \mathrm{C}$. ${ }^{1} \mathrm{H}$ NMR (DMSO- $d_{6}, 298$ K) $\delta_{\mathrm{H}} \mathrm{ppm}: 1.72-1.82(2 \mathrm{H}, \mathrm{m}), 2.28-2.42(4 \mathrm{H}, \mathrm{m}), 2.83(4 \mathrm{H}, \mathrm{t}, J=$ $15.7 \mathrm{~Hz}), 3.17\left(2 \mathrm{H}\right.$, br.s), $3.49\left(2 \mathrm{H}, \mathrm{d},{ }^{3} J=9.7 \mathrm{~Hz}\right), 3.65(2 \mathrm{H}, \mathrm{t}, J$ $=13.3 \mathrm{~Hz}), 4.42(2 \mathrm{H}, \mathrm{t}, J=12.6 \mathrm{~Hz}), 4.72-4.80(4 \mathrm{H}, \mathrm{m}), 5.43(2 \mathrm{H}$, d, $\left.{ }^{3} J=8.6 \mathrm{~Hz}\right), 7.42\left(2 \mathrm{H}, \mathrm{t},{ }^{3} J=7.0 \mathrm{~Hz}\right), 7.51\left(4 \mathrm{H}, \mathrm{t},{ }^{3} J=7.0 \mathrm{~Hz}\right)$, $7.73\left(8 \mathrm{H}, \mathrm{d},{ }^{3} J=7.2 \mathrm{~Hz}\right), 7.83\left(4 \mathrm{H}, \mathrm{d},{ }^{3} J=7.7 \mathrm{~Hz}\right)$, four protons are overlapped by the signal of $\mathrm{CHD}_{2}$.

1,8-Bis(2-naphthylmethyl)-1,4,8,11-tetraazacyclotetradecane (5). Yield $2.16 \mathrm{~g}(90 \%)$, white crystalline powder, m.p.

127-129 ${ }^{\circ} \mathrm{C}$. ## Results and Discussion

Macrobicycles comprising the cyclam fragments can be planar-chiral provided that the chain that forms the second cycle does not rotate around the cyclam moiety. We established that the derivatives of the trans-dibenzylcyclam which do not contain additional substituents at two other nitrogen atoms cannot be planar-chiral because even a short diaminotrimethylene chain easily rotates around the cyclam moiety at room temperature. In this connection we synthesized a series of $N, N^{\prime}, N^{\prime \prime}, N^{\prime \prime}$ '-tetrasubstitued cyclams bearing two bromine atoms in aromatic substituents, in which additional groups could hinder the rotation of the chain around the cyclam moiety. The reaction of bis-formaldehyde-cyclam (1) with bromomethylarenes (2 equiv.) in $\mathrm{CH}_{3} \mathrm{CN}$ led to corresponding di-salts 2 and 3 which were deprotected using aqueous solutions of NaOH at $80-90^{\circ} \mathrm{C}$. As a result, trans-disubstituted cyclams 5 and $\mathbf{6}$ were obtained in good overall yields ( $70 \%$ for the compound 5 bearing two naphthylmethyl substituents and $61 \%$ for the compound 6 containing two biphenylmethyl substitutents). The compounds 4-6 were modified with two $m$-bromobenzyl substituents using 2 equiv. of $m$-bromobenzyl bromide in a two-phase $\mathrm{H}_{2} \mathrm{O}-\mathrm{CH}_{2} \mathrm{Cl}_{2}$ system with NaOH as a base to give tetrasubstituted derivatives 7-9 in yields 40-95 \% (Scheme 1). It is noteworthy that the application of other solvents like $\mathrm{CH}_{3} \mathrm{CN}$ and other bases like $\mathrm{K}_{2} \mathrm{CO}_{3}$ as well as the attempts to introduce first $m$-bromobenzyl substituents followed by the introduction of arylmethyl groups were all unsuccessful due to the formation of numerous by-products caused by the quaternization of the nitrogen atoms of cyclam.

We obtained monocrystals of the compound 9 and its molecular structure was studied by X-ray analysis (Figure 1). In the crystalline form two bromine atoms are oriented in the opposite directions but in the solution due to easy rotations around $\mathrm{C}\left(\mathrm{sp}^{2}\right)-\mathrm{C}\left(\mathrm{sp}^{3}\right)$ and $\mathrm{C}\left(\mathrm{sp}^{3}\right)-\mathrm{N}$ bonds these bromine

Scheme 1.
atoms can be oriented in the same direction to favor the formation of the second macrocycle; this was further verified experimentally.

We studied the Pd-catalyzed amination of the compounds 7-9 with diamines 10a-c using racemic BINAP in order to check the possibility of the macrocyclization reactions leading to the formation of macrobicycles 1113, and then a series of different chiral ligands $((R)$ - and (S)-BINAP, L1-L8) were tested to study the asymmetric induction (Scheme 2). The results are given in the Table 1. Enantiomeric excess was determined using HPLC with a chiral stationary phase. At first the reactions of tetrabenzyl substituted cyclam 7 were studied. The best chemical yields of macrobicycle 11a (40-50 \%) were achieved using ligands L1, L2, L4, L6, L7 (entries 3, 4, 6, 8, 9), while traditional BINAP provided 22-28 \% yields (entries 1, 2). As for enantiomeric excess, only ligands L3, L4, L7 were to some extent efficient providing 9,11 and $13 \% e e$, respectively (entries 5, 6, 9). For the synthesis of 11b, ligand $\mathbf{L} \mathbf{3}$ was

Figure 1. Molecular structure of the cyclam derivative 9.
better than BINAP considering its chemical yield (entries 11 and 12), however, the asymmetric induction was too small though the chain of the corresponding amine was shorter (4 atoms in 10b vs 5 atoms in 10a). Ligand $\mathbf{L 3}$ afforded equal

| 23 | Biph | $\mathrm{NH}_{2} \mathrm{CH}(\mathrm{Ph}) \mathrm{CH}(\mathrm{Ph}) \mathrm{NH}_{2} \mathbf{1 0}$ c | L3 | 13c, 22 | 5 | - |

enantiomeric excess ( $9 \%$ ) in the reactions of bisnaphthyl and bisbiphenyl derivatives 8 and 9 with diamine 10a (entries 15,19 ), and it was again inefficient in the reaction with $1,2-$ ethanediamine ( $\mathbf{1 0 b}$ ) (entry 21). The use of a more sterically hindered 1,2-diphenyl-1,2-ethanediamine (10c) provided a better result regarding chemical yield of the corresponding macrobicycle 13c and the possibility of asymmetric induction (entries 22, 23). The general feature of all studied reactions was the fact that enantiomeric induction was better for a longer diamine 10a and almost was not dependent on the nature of arylmethyl substitutents introduced in the cyclam moiety to ensure planar chirality.

The formation of macrotricyclic by-product 14 was observed in some reactions of compound 7 with diamine 10a (entries 1, 4-6, 8). The yields reached $50 \%$ and were comparable with those of the target macrobicycle 11a. In two cases (entries 7, 9) the product of monoamination 15 was isolated. NMR spectra of many macrobicycles (11b, 12a,b, 13a-c) are characterized by the signal broadening due to hindered conformational dynamics resulting from the presence of bulky substitutents and short linkers. In many cases satisfactory ${ }^{13} \mathrm{C}$ NMR spectra could be recorded only at elevated temperature ( 328 K ), though many signals were still enough broad ( $\Delta v 1 / 2$ up to 100 Hz ).

## Conclusions

To sum up, we investigated the synthesis of the planar-chiral macrobicycles using Pd-catalyzed amination
of tetrasubstituted cyclams, bearing two 3-bromobenzyl and two arylmethyl substituents, in the presence of various chiral diphosphine ligands, target macrobicyclic compounds were obtained in yields up to $50 \%$, we demonstrated the possibility of enantiomeric induction up to $13 \%$ ee and found out that the best enantiomeric excess was achieved with propanediamine-1,3 notwithstanding the bulkiness of the substituents.
